

Braided Steel Brake Line Kit

Part No.14520, 14521, 14522, 14523, 14524, 14525,14526, 14527, 54520

Earl's Supply, a major braided hose supplier, has had prototype hose assemblies tested to D.O.T. recommendations and they have test reports on file which show that these prototype exceeded D.O.T. recommendations in all categories. Each hose assembly has been pressure tested to 2000 PSI after assembly.

We must, however, provide the following; **WARNING.** Do not install these kits yourself. Have a professional mechanic install them and have him be absolutely positive that there can be no combination of wheel travel that, can cause stretching or crimping of these brake lines.

Note to installing mechanic:

These lines are intended to interchange exactly with the stock brake lines, using all the original clips. It may be necessary to tap the end fittings firmly into place in the chassis mountings, but this is essential. If necessary, spread the "teeth" that retain the hex on the end fittings. Blow out each fitting and hose before installation. Do not over-torque the fittings. Be sure to re-use the copper washers wherever they were used in the original installation.
